About

Stick an image on your desktop, specifically an anime girl.

She loves prime numbers, and is feed on files.

Credits

Idea came from [this project](#), but codes are original.

Run

```
pythonw pet2.py
```

1. Drag her anywhere on the screen.

2. Right click to zoom her and to summon more different images. All possibilities are shown in `files.json`. You can edit this json file to add more images.

3. Right click and choose `Quit` to kill her; choose `QuitAll` to kill all at one time.

4. Drop a file on the image to be "eaten". Press `y` key to confirm and `n` key to cancel. After 5 seconds she'll stop attempting to eat anything.

5. Eaten files can be recovered by eating corresponding `.filedigest` file in `filedigest` folder. The origin file will appear in this folder with a `.rawfile` suffix.

Special Note:

1. `white2black.py` in folder `img` turns an image with white background into transparent background and is not intended to run.

2. `startCode.py` starts VSCode on MY COMPUTER and nobody knows how it'll behave elsewhere.

3. `readme.pdf` is very likely to fall out of date. READ ME!!!
